WHAT IS CLAIMED IS:

- 1. A method of logging in a device to a network of devices, comprising 1 the steps of: 2 storing, in each device, an identification number unique to that device, the 3 identification number having a number of bits, each having a bit position; 4 5 delivering a control code to each device on the network indicating that a login process is to begin; 6 broadcasting a pattern of requests to all devices, each request 7 representing a request to each device to acknowledge whether a given bit 8 9 position of its identification number has a given binary value; receiving acknowledgements from the devices; and 10 traversing a binary tree in response to acknowledgements, thereby 11 determining the identification number of the device. 12
- 2. The method of Claim 1, wherein the network is a wireless network and the broadcasting and receiving steps are performed with wireless signals.

3. The method of Claim 1, wherein the network is a network of 1 calculators. 2 4. The method of Claim 1, wherein the network is a local area network 1 2 of computers. 5. The method of Claim 1, wherein the method is performed by a 1 hardware logic device. 2 6. The method of Claim 1, wherein the method is performed by a 1 processor-based device. 2 7. The method of Claim 1, wherein the first request is a request to 1 acknowledge a one rather than a zero, and wherein the second request is a 2 request to acknowledge a zero rather than a one. 3 8. The method of Claim 1, wherein the acknowledgement is any signal 1

above a noise threshold.

- 9. The method of Claim 1, further comprising the step of maintaining a tracking register associated with each device to track acknowledgements.
- 1 10. The method of Claim 1, wherein each device ceases to send
 2 acknowledgements for subsequent bit positions after it cannot acknowledgement
 3 with respect to any bit position.
- 1 11. The method of Claim 1, further comprising the step of ending the login process if two successive requests for values of the same bit position are not acknowledged.

- 1 12. A method of logging in a device to a network of devices, comprising 2 the steps of:
- storing, in each device, an identification number unique to that device, the identification number having a number of bits, each having a bit position;
- delivering a control code to each device on the network indicating that a login process is to begin;
- broadcasting a first request to all devices, the first request representing a request to each device to acknowledge whether the first bit position of its identification number has a zero:
 - receiving acknowledgements from the devices in accordance with the following steps:
 - if an acknowledgement to the first request is received, repeating the broadcasting step for the next bit position of the identification number;
 - if no acknowledgement to the first request is received broadcasting a second request to all devices, the second request representing a request to each device to acknowledge whether the first bit of its identification number is a one; and if an acknowledgement to the second request is received, repeating the first broadcasting step for the next bit position of the identification number; and if no acknowledgement to the second request is received, ending the login process;

20	repeating the broadcasting and receiving steps for each bit position of the
21	identification number; and
22	traversing a binary tree in response to acknowledgements, thereby
23	determining the identification number of the device.
1	13. A network controller for login in a device to a network of devices,
2	comprising:
3	processing circuitry for performing the following tasks:
4	delivering a control code to each device on the network indicated that a
5	login process is to begin;
6	broadcasting a pattern of requests to all devices, each request
7	representing a request to each device to acknowledge whether a given first bit
8	position of its identification number has a given binary value;
9	receiving acknowledgements from the devices; and
10	traversing a binary tree in response to acknowledgements, thereby
11	determining the identification number of the device.

- 1 14. The controller of Claim 13, wherein the processing circuitry is a 2 programmable logic device.
- 1 15. The controller of Claim 13, wherein the processing circuitry is a 2 processor and program memory.
- 1 16. The controller of Claim 13, wherein the network is a local area 2 network of computers, and the controller is part of a network server.
- 1 The controller of Claim 13, wherein the network is a network of calculators, and the controller is a hardware communications controller.
